

Roof mounted hauling / storage cradle

Details

Roof mounted electrically winched hauling and storage cradles manufactured with steel bracketry and an aluminium truss structure with a PVC storage area in a wide range of colours to suit your facility. These cradles are used for:

- cricket practice netting or sports hall division netting which needs to be lifted above windows or other obstacles in the end walls of a sports hall or in areas in front of viewing galleries to prevent the stored netting blocking the view of the sport
- gymnastic soft play shapes or similar lightweight gymnastics and play items - to store such items in the roof space to free up space in the gym.

These cradles are operated by means of a heavy duty 3-phase electrical winch with a wall fixed control panel. 3-phase power is therefore necessary.

Storage / hauling cradles must either be fixed to primary structural steelwork or secondary steelwork provided for the purpose.
